DESCRIPTORS	Birth Rate; Census Figures; Cohort Analysis; Death; *Demography; Futures (of Society); Immigrants; *Population Growth; *Population Trends; Prediction; Racial Composition; Research Methodology; *Statistical Studies
IDENTIFIERS	*United States

ABSTRACT

This report provides projections of the U.S. population by age, race, and sex, and of the components of population change (births, deaths, and migration). Statistical tables project the population increase annually from 1977 to 2000, and in less detail from 2000 to 2050. The author stresses that these reports are projections rather than predictions, given the uncertainty of certain variables such as the birth rate. As of July 1, 1976, the U.S. population was 215 million. Projections indicate that the population will increase to between 246 million to 283 million by the year 2000. Limitations of the report are: (1) projections are based on the assumption that no major catastrophes such as wars or epidemics will occur; and (2) the assumed level of immigration at 400,000 per year does not include illegal immigration or emigration patterns. The introduction to the report explains the methodology of the research. Text and detailed tables form the major portion of the report. Fertility, mortality, and immigration data, projections regarding components of change in relationship to age and sex, plus an estimated completeness of coverage are included in appendices. (KC)

Documents acquired by ERIC include many informal unpublished materials not available from other sources. ERIC makes every effort to obtain the best copy available. Nevertheless, items of marginal reproducibility are often encountered and this affects the quality of the microfiche and hardcopy reproductions ERIC makes available via the ERIC Document Reproduction Service (EDRS). EDRS is not responsible for the quality of the original document. Reproductions supplied by EDRS are the best that can be made from the original.

ACKNOWLEDGMENTS

This report was prepared by **Campbell Gibson**, Chief, Population Projections Branch. Statistical assistance was provided by **Pauline B. Shell** and **Mary Lynn Allen**. Computer applications and programming were provided by **Jerome M. Glynn**, with the assistance of **Marion T. Fox**. Editorial assistance was provided by **Vivian Brown** and **Marion Porter**. Professional consultation and review were provided by **Richard A. Engels**, **Jacob S. Siegel**, and **Signe Wetrogan**.

The assumptions about future mortality are based largely on the research of **Francisco Bayo** and **Richard S. Foster**, Office of the Actuary, Social Security Administration.

PROJECTIONS OF THE POPULATION OF THE UNITED STATES: 1977 TO 2050

(These projections supersede those published in October 1975 in **Current Population Reports**, Series P-25, No. 601)

INTRODUCTION

This report presents projections of the United States population by age and sex and of the components of population change (births, deaths, and migration). These projections are shown annually by race (White and Black) from 1977 to 2000 and in less detail for the total population from 2000 to 2050.[1]

The projections presented in this report supersede those previously published in report No. 601. They have been updated primarily to incorporate recent mortality trends and recent research on projections of mortality into the population projections. The following discussion of the underlying assumptions and methodology focuses on the major differences between the two reports.[2]

The population base, which is consistent with the population enumerated in the 1970 census, has been updated from July 1, 1974 to July 1, 1976.

The ultimate levels of completed cohort fertility (average number of lifetime births per woman) are the same as in report No. 601: Series I - 2.7, Series II - 2.1, and Series III - 1.7. In the short term, assumptions about future fertility have been lowered slightly to reflect recent trends in annual fertility and in the birth expectations of young married women.

The assumptions about future mortality have been revised to reflect the recent decline in age-specific death rates in the middle and older adult ages and recent research on future trends in mortality.[3] Average life expectancy at birth is assumed to increase from 69.1 to 71.8 years for males and from 77.0 to 81.0 years for females between 1976 and 2050. In report No. 601, the assumed increase was from 67.9 to 69.9 years for males and from 75.7 to 78.0 years for females between 1972 and 2020.

The assumed level of net immigration (immigration minus emigration) is 400,000 per year, the same as in report No. 601, and reflects the recorded level of legal immigration in recent years. This figure does not include any allowance for illegal immigration because of the current lack of reliable estimates of the illegal alien population in the United States or of its rate of change,[4] nor does it allow for all emigrants leaving the United States because of the lack of reliable data on emigration. (For further discussion of the assumptions about the components of population change, see the section on Assumptions.)

If past trends in the components of population change are a useful guide, fertility is the component of population change that is subject to the greatest uncertainty in the future. Because of the difficulty of ascertaining the annual number of future births, even in the short run, alternative assumptions were made about the course of fertility. Together, these assumptions appear to provide a reasonable range. Even if one of the alternative assumptions about cohort fertility turns out to be essentially correct, the trend in annual births could differ greatly from that projected because of changes in the timing of childbearing. (See also sections on Limitations and on Selection of Projection Series.)

In addition to the three main projection series, this report includes one supplemental projection, Series II-X, which assumes the Series II level of future fertility and no net immigration. Series II-X illustrates one extremely simple, albeit unrealistic, approach to zero population growth, and a comparison of Series II and Series II-X illustrates the

---

[1] In addition to data for the White population and the Black population, some of the detailed tables in this report include data for the population of "Black and other races" (i.e., all races other than White) for use in situations in which corresponding data series for the Black population alone are not available.

[2] See Bureau of the Census, **Current Population Reports**, Series P-25, No. 601, "Projections of the Population of the United States: 1975 to 2050" (October 1975). Report No. 601 is cited throughout the text of this report for more detailed discussion and for comparative purposes.

effect of the assumption of 400,000 net immigration per year on population growth (appendix D).[5]

The population projections in this report, as in report No. 601, were prepared using the inflation-deflation variant of the standard cohort-component method. Population projections prepared with the inflation-deflation procedure reflect the percent (not the absolute amount) of estimated net census undercount by age at the latest census. As a result, use of the inflation-deflation procedure preserves the actual pattern of population change over time by age rather than by cohort. (For further discussion, see the section on Methodology.)

COMPARISONS WITH ESTIMATES AND PREVIOUS PROJECTIONS

Comparison with estimates. For the purpose of assessing the projections in report No. 601 in the short term, estimates and projections of population change for the period July 1, 1974 to July 1, 1976 are shown in table A. Under Series II,[6] the projected population growth for the 2-year period was 52,000 (1.6 percent) below the estimated increase. The small size of the difference was partially due to offsetting differences between the reported and projected numbers of births and deaths. For births, the projected figure was 152,000 (2.4 percent)

---

[5] The ultimate cohort fertility assumption of 2.1 in Series II-X represents replacement level fertility, which is the level of fertility required for the population to replace itself with the projected mortality rates and in the absence of net immigration. The Series II-X projection would lead to zero growth (around the middle of the 21st century) and would ultimately produce a stationary population (i.e., a population with a constant age-sex structure).

[6] The Series II projection is used in this comparison because it is consistent with survey data on the birth expectations of young married women whereas Series I and Series III were intended to provide a reasonable range (report No. 601, pp. 21-22).

above the reported figure; for deaths, the projected figure was 239,000 (6.2 percent) above the reported figure. The possibility that annual fertility would drop below the Series II projection in the short term was noted in report No. 601 (pp. 5-7, 126); however, the pronounced declines in age-specific mortality rates in the middle and older adult ages that caused the reported number of deaths to fall well below the projected number of deaths were not anticipated. (See section on Mortality.)

Comparison with previous projections. Projections of total population from 1980 to 2025 in report No. 601 and in this report are presented in table B. Due to the use of a later base date (July 1, 1976 instead of July 1, 1974), the projected population range for each future year is slightly smaller in this report than in report No. 601. While the differences in the two sets of population projections are small, these small differences are due to counteracting changes in projections of births and deaths,[7] which in turn have a significant effect on the projected age structure of the population.

A comparison of Series II projections by age for 1985, 2000, and 2025 in the two reports is shown in table C. In each of the three years, the projected populations representing the survivors of projected births are lower in this report than in report No. 601. These reductions are due to the slight lowering in the short term of the assumptions about future fertility, as noted earlier.

---

[7] For example, the projected population increase from 1976 to 2000 in Series II in report No. 601 was 47.4 million (94.4 million births, 56.6 million deaths, and 9.6 million net immigration), and the corresponding increase in this report is 45.3 million (90.6 million births, 55.0 million deaths, and 9.6 million net immigration). The reduction of 2.2 million in the projected population increase is due to reductions in projected births and deaths of 3.8 million and 1.6 million, respectively.

Table C. Comparison of Series II Projections by Age in Report No. 601 and in This Report: 1985, 2000, and 2025

(Numbers in thousands. As of July 1. Includes Armed Forces overseas. Population figures inside heavy lines represent in whole or in part the survivors of projected births. For meaning of symbols, see text)

[1] Projection in this report minus projection in Report No. 601.
[2] Projection in Report No. 601 is base of percent.

Source: Tables 8 and 11, and Current Population Reports, Series P-25, No. 601, tables 8 and 11.

The projected populations representing the survivors of persons born before the base date of the projections are higher in this report than in report No. 601 due to the use of revised assumptions about future mortality, as noted earlier. The largest increase occurs in the age group 65 years and over, in which the projected population in 2025 is 2.8 million (5.9 percent) higher in this report than in report No. 601.[8]

PROJECTED POPULATION TRENDS

Population size and growth. On July 1, 1976, the population of the United States including Armed Forces overseas was about 215 million and had increased at an average rate of 0.8 percent per year during the early 1970's (tables D and E). While the total population has increased throughout American history, the rate of growth has undergone a long-term decline with the only major interruption being due to the "baby boom" following the Second World War. During the first half of the 19th century, the population of the United States increased at an average rate of about 3 percent per year. Subsequently the growth rate dropped, largely because of a pronounced decline in fertility, to an average of 0.7 percent per year during the 1930's.[9] The annual growth rate then increased to 1.7 percent during the 1950's at the peak of the baby boom before declining again to the current level, which is about equal to the historically low rate of the 1930's.

---

[8] The projected population 65 years and over in 2040 (after which the survivors of projected births enter the age group) in this report is 54.9 million, which is 4.7 million (9.3 percent) above the corresponding figure of 50.3 million in report No. 601.

Against this historical backdrop, the projection series presented in this report suggest that the population of the United States will continue to grow throughout the remainder of the 20th century at rates which could fall below the current low rate and which are unlikely to reach the relatively high rate of the 1950's. The Series II projection, in which the assumed level of future fertility corresponds closely to that suggested by recent survey data on birth expectations,[10] indicates that the total population of the United States would grow from 215 million in 1976 to 260 million in 2000, or by 21 percent. The annual growth rate would increase to 0.9 percent during the 1980's and then would decline to 0.6 percent by the end of this century as it converged toward zero in the long run.[11]

As noted earlier, the fertility assumptions for Series I and Series III were chosen to provide a range which appears likely to encompass future fertility. The resulting projected population range for the year 2000 is 246 million (Series III) to 283 million (Series I). Under Series I, the population would increase by 31 percent between 1976 and 2000, and the annual growth rate would be in the 1.0 to 1.3 percent range. Under Series III, the population would increase by 14 percent between 1976 and 2000, with the annual growth rate dropping to 0.3 percent by the end of this period.

Largely because of the "baby boom" following the Second World War, the United States population has a relatively young age structure and a relatively high proportion of persons in the prime childbearing ages. The resulting momentum for population growth can be illustrated with the Series III projection.

Under Series III, the population would continue to grow during the remainder of this century because the age structure of the population would lead to more births than deaths, despite a fertility assumption well below replacement level. Shortly after the turn of the century, there would be a natural decrease (i.e., deaths would exceed births) which would be offset for a few years by the assumed level of annual net immigration. Around the year 2020, the population would peak at 253 million and then decline because the assumed level of net immigration would not offset the sizable natural decrease that would occur with the Series III fertility assumption and the older age structure that would then exist (tables 2 and 12).

Annual births. It is extremely difficult to determine the annual number of births in future years, even in the short run. This is because the social, economic, and other factors which affect fertility are neither fully understood nor easily predicted. Herein lies a paradox. Because the factors influencing fertility are subject to change and because couples in the United States exercise a high degree of control over reproduction,[12] fluctuations in annual fertility rates are to be expected. However, given the present inability to predict these fluctuations in fertility or in the factors underlying them, it seems preferable to assume a smooth trend in annual total fertility rates toward the ultimate cohort fertility rate in each projection series,[13] with the qualification that the actual trend in the

[10] Bureau of the Census **Current Population Reports,** Series P-20, No. 308, "Fertility of American Women: June 1976." Birth expectations data collected from young wives are subject to error and to change and do not provide any information on the fertility expectations of succeeding cohorts of young women. For a detailed discussion of this topic, see Bureau of the Census, **Current Population Reports,** Series P-25, No. 601, pp. 21-25.

[11] As noted earlier the Series II fertility assumption represents replacement level fertility (footnote 5). The assumption of 400,000 net immigration per year in Series II would lead in the long run to population growth at a declining rate that would approach, but never reach, zero.

annual total fertility rate (and, by extension, the actual trend in the annual number of births) will not be so smooth as shown in these projections.[14]

From 1973 through 1976, the annual number of births in the United States was between 3.1 and 3.2 million. This is the lowest annual figure since 1945 and is well below the 4.3 million births recorded annually during the 1957 to 1961 period.[15] The projection series presented in this report suggest that the annual number of births could again easily reach 4 million within a decade and that the number is unlikely to drop much below the current level during the remainder of this century (table F and table 2).

Except for an initial drop under Series III, the projected number of annual births, which is determined by the projected age-specific birth rates and the projected female population in the childbearing ages, would increase until the mid 1980's under all three-projection series. As shown in table G, the female population in the prime childbearing ages has increased rapidly since 1960 and will continue to increase until the mid 1980's,[16] due to the entry of the large cohorts of the baby boom into this age span. As a result of this increase, Series I and Series II, in which the total fertility rates projected for 1985 are above the current figure (table A-5), show substantial increases in the projected numbers of annual births. Even under Series III, in which the projected total fertility rate for 1985 is below the current figure, projected births for 1985 would be above the current level.

Under Series II, the annual number of births would increase steadily from 3.1 million in 1976 to just over 4 million during the late 1980's and then would drop below 4 million during the 1990's. Under Series I, annual births would increase more rapidly, exceeding 4 million before 1980 and surpassing 5 million in the mid 1980's. Under Series III, annual births would drop slightly below 3 million and then increase to 3.4 million in the early 1980's before beginning a long-term decline that reflects the long-term assumption of fertility below replacement level.

Age structure. Estimated and projected rates of change in population in the various age groups differ considerably from rates of change in total population, primarily because of past fluctuations in the annual number of births. Table H and figure 1 show trends in the population by age group at 5-year intervals from 1950 to 2000.

The population 65 years and over is projected to increase until 2000, but at a declining rate as the relatively small birth cohorts of the 1920's and 1930's reach age 65. This age group constituted 10.7 percent of the total population in 1976, with the projected figures for 2000 ranging from 11.3 percent under Series I to 12.9 percent under Series III.

The populations in the age groups 25 to 34, 35 to 44, 45 to 54, and 55 to 64 will all be larger in 2000 than they are at present; however, the patterns of change will differ greatly, reflecting the sequential effects of past fluctuations in the number of annual births. The largest overall increase will occur in the 35 to 44 age group which is projected to increase by about 18 million (79 percent) between 1976 and 2000.

Population trends up to 2000 in the age groups under 5, 5 to 13, 14 to 17, and 18 to 24 will be determined in varying degree by trends in future births. For example, the projected population under age 5 in 2000 ranges from slightly over 14 million in Series III to nearly 24 million in Series I. Restricting consideration to cohorts already born, the population 5 to 13 will decline during the remainder of the 1970's, the population 14 to 17 will decline through the 1980's, and the population 18 to 24 will increase during the remainder of the 1970's and then decrease during the 1980's and early 1990's.

All three series project an aging of the population (as defined by the median age) during the remainder of this century. The median age, which was 29.0 in 1976, would be 32.5 in 2000 under Series I, 35.5 under Series II, and 37.3 under Series III. The range in these figures reflects the range in the fertility

Long-term projections of the population 65 years and over, which are of particular interest in planning related to retirement and the funding of pension plans,[17] are presented in table I. Projections are shown to the year 2040, after which the figure becomes less certain due to the entry into this age group of persons not yet born. However, it also should be noted that the projections of the population 65 years and over depend heavily on the mortality assumptions used, which of course are subject to error. (See sections on Comparison with Previous Projections and on Mortality.)

---

[17] Board of Trustees of the Federal Old-Age and Survivors Insurance and Disability Insurance Trust Funds, **1976 Annual Report,** 94th Congress, 2nd session, House Document No. 94-505, 1976. Social Security Administration, Office of the Actuary, **United States Population Projections for OASDHI Cost Estimates,** Acturial Study No. 76, June 1977.

The population 65 years and over, which is projected to grow at a declining rate during the remainder of the 20th century, is projected to grow from 32 million in 2005 to 55 million in 2030 due primarily to the entry of the large birth cohorts of the baby boom into the age group. The projected increase of 23 million in this 25-year period is equal to the current population 65 years and over. Under Series II, the projected population 65 years and over would increase from 12.1 percent to 18.3 percent of the total population between 2005 and 2030. The corresponding increases under Series I and Series III would be 10.9 percent to 14.0 percent and 13.0 percent to 22.1 percent, respectively.

PROJECTIONS OF RESIDENT AND CIVILIAN POPULATION

The population projections in this report are for the total population of the United States including Armed Forces overseas. For some purposes, it is desirable to have projections of the resident population (i.e., excluding Armed Forces overseas) or the civilian population (i.e., excluding all Armed Forces, both in the United States and overseas). In the absence of projections of the number of Armed Forces personnel, it may be useful to make the simple and arbitrary assumption that the Armed Forces population will remain the same as it was on July 1, 1976, the base date of these projections (table J).

LIMITATIONS

The population projections presented here are based on the general assumption that there will be no large-scale war, widespread epidemic, or other major catastrophe. While future levels of mortality and net immigration cannot be predicted exactly, changes in these two components are likely to have less impact than changes in fertility on the size and composition of future population. As a result, projections of the population born after the July 1, 1976 base date are less reliable than projections of the population born earlier. The larger the proportion of a projected population born after the base date, the more uncertain is the projection of that population.

SELECTION OF PROJECTION SERIES

The assumptions about the future course of the components of population change and the possibility of error in these assumptions have been discussed briefly. The purpose of this section is to contrast projections, predictions, and forecasts of population and to provide some guidance for the selection of a projection series or a projected population range.[18]

Population projections are "correct" by definition (except for computational errors) because they indicate the population that would result if the base date population is correct and if the underlying assumptions should turn out to be correct. Thus without an evaluation of the assumptions, there is no basis for choosing among alternative projections.

If future population could be determined with negligible error, then only one projection series would be necessary, and it could be offered as a prediction. However as discussed earlier, this is not the case.

Population projections and population predictions thus represent the two ends of a scale. The area in between is represented by population forecasts. A population forecast may be thought of as a population projection accompanied by an indication of its accuracy. Ideally, this would be in the form of a statistical confidence interval, but the factors influencing population trends are neither perfectly understood nor perfectly predictable themselves. Thus in practice, the indications of accuracy accompanying population projections usually represent individual (or collective) judgments which may differ greatly, even among experts.

The attempt was made here to select reasonable assumptions about the future course of the components of population change and thus implicitly to "forecast" future population.[19] However, the figures presented in this report are conservatively labeled as projections rather than forecasts to emphasize the difficulty of accurately projecting population and the importance of considering the purposes for which the figures are to be used.

---

Even if potential users agreed about the reasonableness of a set of population projections, they might select different projection series (or projected population ranges) to reflect the differing consequences of possible inaccuracy in varying situations.[20] For example, use of a population projection that turns out to be too high might incur costs for providing goods or services that are not needed whereas if the projection used turns out to be too low, the goods and services provided might not be sufficient to satisfy the demand. The user's assessment of these consequences determines whether he selects a population series (or a projected population range) that appears "safe" on the high side, that appears most accurate (meaning that the consequences of errors of equal magnitude on the high side and the low side are perceived to be equally undesirable), or that appears "safe" on the low side.

METHODOLOGY

These projections were prepared using the inflation-deflation variant of the cohort-component method. In the cohort-component method, the components of population change (births, deaths, and net immigration) are projected separately for each birth cohort (persons born in each year). The initial (base date) population is carried forward year by year using projected survival rates and projected net immigration by single year of age, sex, and race. Annual births are projected for each future year and are carried forward in the same manner as the cohorts born before the base date.[21]

The inflation-deflation procedure starts with the latest census population adjusted for estimated net census undercount by age, sex, and race.[22] This inflated population is carried forward to the base date (with data on births, deaths, and net migration) and on to future years using the cohort-component method. For each future year the projected population is deflated to reflect the percent of estimated net census undercount by age, sex, and race at the latest census. Finally, a small pro rata adjustment is made in the deflated figures by age, sex, and race to bring them into exact agreement with an independent estimate of the population in each sex-race group obtained by carrying forward the census population with information on subsequent births, deaths, and net immigration without regard to age.

---

[20] This concept is defined mathematically as the user's loss function. See Keyfitz, "On Future Population," p.356.

Source: Table H and tables 6-12.

The cohort-component method used alone preserves the actual pattern of population change by cohort whereas the inflation-deflation variant preserves the actual pattern of population change by age. The inflation-deflation variant is generally preferable because the vast majority of users of estimates and projections by age are interested in change over time in population in specific ages or age groups and not in change over time in cohorts.[23]

While population projections adjusted for estimated net census undercount are not published in this report, the figures can be approximated using the published projections in conjunction with estimated coverage ratios shown in appendix table E-1. The use of table E-1 can be illustrated with an example relating to the population 65 years and over. The projected population 65 years and over in 2000 is 31.8 million (table H). This figure divided by .98250 (the coverage ratio shown in table E-1) yields a projection in 2000 of the population 65 years and over adjusted for estimated net census undercount of about 32.4 million.

ASSUMPTIONS

General. As noted in the previous section, the cohort-component method of projecting population requires separate assumptions about future fertility, mortality, and net immigration. These assumptions are discussed in detail only to the extent that they differ significantly from the assumptions used in preparing the previous national population projections (report No. 601, pp. 21-27).

Fertility. While the ultimate levels of completed cohort fertility are the same as in report No. 601, the projected levels of cohort fertility for women now in the young childbearing ages are slightly lower in this report in each of the three projection series. These changes reflect a drop of about one-tenth of a child in the average number of lifetime births expected by married women 18 to 24 years old. This decline is based on survey data for the 1971-74 period, which were used in report No. 601, and on survey data for the 1974-76 period, which were used in this report.[24] Consistent with this decline in birth expectations and with the decline of about one-tenth of a child in the total fertility rate between 1973 and 1975 (table A-5), the projected total fertility rates in each of the three projection series for the first several years of the projection period are slightly lower in this report than in report No. 601.

---

[23] For a more detailed discussion of the methodology including an illustration of the inflation-deflation variant of the cohort-component method and a discussion of the limitations of population projections adjusted for estimated net census undercount, see report No. 601, pp. 16, 18, 20-21.

In report No. 601, the ultimate completed cohort fertility rates in the three projection series were first attained exactly by the birth cohort of 2001. This situation occurred because the projected fertility rates for other races (i.e., races other than White and Black) were generated on a period basis with the ultimate levels being reached in 2015 at which time the youngest cohort in the childbearing ages (14-49) would be the cohort of 2001. In generating the projected fertility rates in this report for other races, it was assumed also that the ultimate level would be attained first by the 1980 birth cohort. Since the ultimate levels of cohort fertility for White and Black females are assumed to be reached starting with the 1970 birth cohort (tables A-2 and A-3), the ultimate level of cohort fertility for all races combined is first attained by the 1980 cohort.

As in report No. 601, the ultimate mean age of childbearing for each of the three projection series is 26.0, and some adjustments were made in the fertility rates projected on a cohort basis to make certain that the implied trends in projections of annual total fertility rates appeared reasonable. The changes in projected fertility between report No. 601 and this report can be seen in detail by a comparison of tables A-1, A-2, A-3, A-5, A-6, and A-7 in the two reports.

Mortality. One set of mortality projections assuming a slow and steady reduction in future mortality is used in this report. This general assumption parallels that used in report P-25, No. 601; however, there are two important differences in the mortality projections developed for the two reports.

First, the base date mortality in this report (1976) is significantly lower than both the base date mortality (1972) and the projected mortality implied for 1976 in report No. 601 (tables K & L). Second, the decline in future mortality is assumed to continue to 2050 for all races. In report No. 601, the reduction in mortality was assumed to continue only to 2000 for Whites and other races and to 2020 for Blacks (table L).

When report No. 601 was prepared, the latest national mortality data available by age, sex, and race were for 1972. Provisional data on total deaths showed a decrease from 1,975,000 in the year ending June 30, 1973 to 1,950,000 in the following year; however, since the trend in annual deaths in the preceding two decades included several 1-year declines in deaths (report No. 601, table 1), this drop was not interpreted to imply any more than a short-term fluctuation.

In fact, the absolute number of deaths continued to decline through the year ending June 30, 1976 to 1,913,000, the lowest figure since the year ending June 30, 1968 (table 1). The 3 percent decline in 3 years in the number of deaths occurred in the face of a continued increase in total population and a continued aging of the population, as measured by median age and the proportion 65 years and over (table H). As shown in table K, death rates in the middle and older adult ages (35 years and over), which account for about 90 percent of deaths, declined much more rapidly from 1973 to 1975 than from 1960 to 1973. (Final mortality data by age, sex, and cause are published for calendar years rather than for years ending June 30.) By cause, the decline from 1973 to 1975 was due largely to a reduction in mortality from major cardiovascular diseases.[25] It is of course not known if the recent accelerated declines in mortality will continue or if they represent a short-term trend.

The survival rates for 1976 are consistent with an estimated population for 1976 based on the 1970 census population adjusted for estimated net census undercount. Mortality rates by 5-year age group, sex, and race were computed for 1974 using final data on deaths.[26] These rates were then adjusted to be consistent with provisional data on

Source: Current Population Reports, Series P-25, No. 643, tables 1-3.

deaths by age and sex for 1975.[27] The resulting rates were then adjusted again to be consistent with an assumed total of 1,925,000 deaths in 1976. This figure reflects provisional data on deaths through June 1976.[28] Finally, mortality rates for age groups from 65 to 69 years to 85 years and over were adjusted to reflect the pattern of mortality rates based on Medicare data because of the distortion in old-age mortality rates derived from registered deaths and census-based estimates of population.[29] Estimated mortality rates for 1976 were then used to generate life tables by single year of age, sex, and race from which 1976 survival rates were calculated (table B-3).

The projections of future mortality used in this report were adapted from mortality projections to 2050 recently prepared by the Office of the Actuary of the Social Security Administration (SSA).[30] These mortality projections were based on an analysis of mortality trends and prospects by age, sex, and cause of death. Because the SSA mortality projections are for the total population (i.e., all races) and because recent mortality projections by race are unavailable, it was necessary to adapt the SSA mortality projections to include race. Given the general similarity between mortality rates for Whites and for other races (i.e., races other than White or Black), and given that mortality rates in each age-sex group of the other races population are subject to possible distortion due to the lack of comparability in the definition of race on death certificates and in the census of population, projected mortality rates for the White population and other races population combined were used for each of these populations.

The proportionate reductions in mortality rates by age and sex between 1974 and 2050 in the SSA mortality projections were assumed for Whites and other races between 1976 and 2050. It was assumed that the resulting ultimate pattern of mortality would also be attained in 2050 by Blacks.

Projected survival rates for years between 1976 and 2050 were obtained by geometric interpolation. More specifically it was assumed that the annual proportionate change in the proportion dying (i.e., the complement of the survival rate) in each age-sex race cell would be constant between 1976 and 2050. Estimated and projected survival rates by age, sex, and race are shown in tables B-1 through B-3.

Estimated and projected values of life expectancy at birth consistent with the survival rates in report No. 601 and in this report are shown in table L. The average increase per year in life expectancy at birth for all races in the interval from the base date to the ultimate date is the same in the two reports; however, the longer interval used in this report yields a greater increase in life expectancy. In 1976, average life expectancy for females exceeded that for males by 7.9 years. The differential by sex in average life expectancy at birth is projected to increase to 9.2 years in this report.

Net immigration. The assumed level of net immigration (immigration minus emigration) in this report is 400,000 per year, the same as in report No. 601, and reflects the recorded level of legal immigration in recent years. This figure does not include any allowance for illegal immigration because of the current lack of reliable estimates of the illegal alien population in the United States or of its rate of change. Also the figure does not allow for all emigrants leaving the United States because of the lack of reliable data on emigration, both for persons born in the United States and for persons born outside the United States who previously had immigrated to the United States.

The distribution of net immigration by age, sex, and race is based largely on data on alien immigration by age, sex, and country of origin. In report No. 601, the distribution reflected data for the year ending June 30, 1973, and in this report, the distribution reflects data for the year ending June 30, 1975.[31] The resulting distributions of the assumed level of 400,000 net immigration in the two reports are similar (table C-1 in each report).

SYMBOLS

A dash "–" represents zero or rounds to zero, three dots ". . ." mean not applicable, and "NA" means not available.

ROUNDING

Except where otherwise noted, the figures in this report have been rounded independently from figures computed to the last digit; hence the sum of parts may differ from the totals shown. Derived measures are based on unrounded figures. Median ages are based on data for 5-year age groups.

RELATED REPORTS

These national population projections supersede those published in October 1975 in **Current Population Reports**, Series P-25, No. 601. The projections in this report are consistent with estimates of total population and the components of change published in July 1976 in P-25, No. 632 and with estimates of population by age, sex, and race for July 1 of each year since 1900 as follows: 1900-1959 in P-25, No. 311 (July 1965); 1960-1969 in P-25, No. 519 (April 1974); 1970-1973 in P-25, No. 614 (November 1975); 1974-1976 in P-25, No. 643 (January 1977).

National projections of households and families consistent with the population projections in P-25, No. 601 were published in August 1975 in P-25, No. 607. Annual projections of first births consistent with the projections of total births in P-25, No. 601 were published in November 1975 in P-25, No. 613. National projections of households and families and population projections for States consistent with the national population projections in this report are planned for publication during 1977.

Table 1. ANNUAL ESTIMATES OF POPULATION AND THE COMPONENTS OF POPULATION CHANGE, BY RACE, FOR THE UNITED STATES: 1940 TO 1976

(Numbers in thousands. Includes Armed Forces overseas. Includes Alaska and Hawaii in all years)

Series and year (July 1 to June 30)	Population at beginning of year	Percent change during year	Population change during year					Rate per 1,000 midyear population				
			Net change[1]	Natural increase	Births[2]	Deaths[3]	Net immigration	Net change	Natural increase	Births	Deaths	Net immigration

[1] Includes estimates of overseas admissions into and discharges from the Armed Forces and the "error of closure" between censuses. For further information, see Current Population Reports, Series P-25, No. 545, pp. 6, 10 and 11.

[2] Adjusted for underregistration through March 1970.

[3] Deaths occurring in the United States plus estimated deaths occurring to Armed Forces overseas. Infant deaths adjusted for underregistration through March 1960.

Source: Current Population Reports, Series P-25, No. 632, tables 1 and 4, and unpublished data for the year ending June 30, 1976.

Table 2. TOTAL POPULATION—ANNUAL PROJECTIONS AND COMPONENTS OF CHANGE, FOR THE UNITED STATES: 1976 TO 2050

(Numbers in thousands. Includes Armed Forces overseas. See text for methodology and assumptions)

Series and year (July 1 to June 30)	Population at beginning of year	Percent change during year	Population change during year					Rate per 1,000 midyear population				
			Net change	Natural increase	Births	Deaths	Net immigration	Net change	Natural increase	Births	Deaths	Net immigration

Table 2. TOTAL POPULATION—ANNUAL PROJECTIONS AND COMPONENTS OF CHANGE, FOR THE UNITED STATES: 1976 TO 2050—Continued

(Numbers in thousands. Includes Armed Forces overseas. See text for methodology, assumptions, and meaning of symbols)

Series and year (July 1 to June 30)	Population at beginning of year	Percent change during year	Population change during year					Rate per 1,000 midyear population				
			Net change	Natural increase	Births	Deaths	Net immigration	Net change	Natural increase	Births	Deaths	Net immigration
SERIES III												
1976-1977	215,118	0.7	1,487	1,087	3,037	1,950	400	6.9	5.0	14.1	9.0	1.9

[1] A birth cohort is defined as those women born in the 12-month period centered on the beginning of the year in question. (For example, the 1900 cohort is comprised of females born July 1, 1899 to June 30, 1900.)

[2] Estimates of cumulative and completed cohort fertility rates in this report differ slightly from the rates published recently in Robert L. Heuser, Fertility Tables for Birth Cohorts by Color: United States, 1917-1973, DHEW publication No. (HRA) 76-1152, U.S. Government Printing Office, 1976. In the latter report, central birth rates were smoothed due to age heaping prior to the 1950's (p. 455).

Table A-2. WHITE FEMALES—ESTIMATES AND PROJECTIONS OF CUMULATIVE FERTILITY BY AGE AND OF COMPLETED FERTILITY: SELECTED BIRTH COHORTS, 1900 TO 1970

(Rates represent cumulative live births per 1,000 women up to age indicated. Figures below heavy lines in each block are based in whole or in part on projected fertility. See text for discussion of methodology and assumptions)

---

[1] A birth cohort is defined as those women born in the 12-month period centered on the beginning of the year in question. (For example, the 1900 cohort is comprised of females born July 1, 1899 to June 30, 1900.)

[2] Estimates of cumulative and completed cohort fertility rates in this report differ slightly from the rates published recently in Robert L. Heuser, Fertility Tables for Birth Cohorts by Color: United States, 1917-1973, DHEW publication No. (HRA) 76-1152, U.S. Government Printing Office, 1976. In the latter report, central birth rates were smoothed due to age heaping prior to the 1950's (p. 455).

Table A-3. BLACK FEMALES—ESTIMATES AND PROJECTIONS OF CUMULATIVE FERTILITY BY AGE AND OF COMPLETED FERTILITY: SELECTED BIRTH COHORTS, 1900 TO 1980

(Rates represent cumulative live births per 1,000 women up to age indicated. Figures below heavy lines in each block are based in whole or in part on projected fertility. See text for discussion of methodology and assumptions)

Series and birth cohort of women[1]	Cumulative fertility rates[2]						Completed cohort fertility rate[2]	Mean age of childbearing	Median age of childbearing
	Up to age 20	Up to age 25	Up to age 30	Up to age 35	Up to age 40	Up to age 45

[1] A birth cohort is defined as those women born in the 12-month period centered on the beginning of the year in question. (For example, the 1900 cohort is comprised of females born July 1, 1899 to June 30, 1900.)

[2] Estimates of cumulative and completed cohort fertility rates in this report differ slightly from the rates published recently in Robert L. Heuser, Fertility Tables for Birth Cohorts by Color: United States, 1917-1973, DHEW publication No. (HRA) 76-1152. U.S. Government Printing Office, 1976. In the latter report, central birth rates were smoothed due to age heaping prior to the 1950's (p. 455).

[3] Estimates for cohorts born before 1950 are based in whole or in part on rates for females of Black and other races. See table A-7, footnote 2.

Table A-4. ESTIMATES OF FERTILITY RATES BY RACE FOR 1975 AND PROJECTIONS OF ULTIMATE FERTILITY RATES, BY SINGLE YEAR OF AGE

(Rates represent live births per 1,000 women. These rates are central birth rates which are based on births adjusted for underregistration and females adjusted for estimated net census undercount. See text for discussion of methodology and assumptions)

[1] Estimates of total fertility rates differ slightly from those published by the National Center for Health Statistics. The estimates in this report are the sum of central birth rates which are based on births adjusted for underregistration and females adjusted for estimated net census undercount. The total fertility rates published annually by the National Center for Health Statistics are the sum of age-specific birth rates. The estimates of total fertility rates and central birth rates in this report also differ slightly from the rates published recently in Robert L. Heuser, Fertility Tables for Birth Cohorts by Color: United States, 1917-1973, DHEW Publication No. (HRA) 76-1152, U.S. Government Printing Office, 1976. In the latter report, central birth rates were smoothed due to age heaping prior to the 1950's (p. 455).

[2] Estimated rates for 1975 are based on provisional data on total births and 1972 to 1974 trends by age and race.

Table A-6. WHITE FEMALES—ESTIMATES AND PROJECTIONS OF TOTAL FERTILITY RATES AND FERTILITY RATES BY AGE: SELECTED YEARS, 1925 TO 2000

(Rates represent live births per 1,000 women. See text for discussion of methodology and assumptions)

---

[1] Estimates of total fertility rates differ slightly from those published by the National Center for Health Statistics. The estimates in this report are the sum of central birth rates which are based on births adjusted for underregistration and females adjusted for estimated net census undercount. The total fertility rates published annually by the National Center for Health Statistics are the sum of age-specific birth rates. The estimates of total fertility rates and central birth rates in this report also differ slightly from the rates published recently in Robert L. Heuser, Fertility Tables for Birth Cohorts by Color: United States, 1917-1973, DHEW Publication No. (HRA) 76-1152, U.S. Government Printing Office, 1976. In the latter report, central birth rates were smoothed due to age heaping prior to the 1950's (p. 455).

[2] Prior to 1964, data are not available for Black females. Estimates are for females of Black and other races of whom 92 to 98 percent were Black in each 5-year age group in the 10-49 age span in each census from 1920 to 1960.

[3] Estimated rates for 1975 are based on provisional data on total births and 1972 to 1974 trends by age and race.

Table A-8. AVERAGE ANNUAL ESTIMATES AND PROJECTIONS OF GENERAL FERTILITY RATES, BY RACE: 1970 TO 2000

(Rates per 1,000 women 15 to 44 years of age. Rates based on births shown in tables 1-5 of this report and midyear female populations derived from **Current Population Reports**, Series P-25, Nos. 614 and 643 and from tables 6-9 in this report)

Table B-1. TOTAL POPULATION—ESTIMATES AND PROJECTIONS OF FIVE-YEAR SURVIVAL RATES BY AGE AND SEX: 1976 TO 2050

(Projected survival rates are based on projections of population in 5-year age groups assuming no net immigration. These rates reflect projected survival rates by single year of age and the age distribution within each age group. These survival rates are consistent with population adjusted to reflect estimated net census undercount. See text for discussion of methodology and assumptions)

[1] Based on life tables for 1976.

[2] Based on life tables by sex for 2050 assuming a sex ratio at birth of 105 males per 100 females.

[3] After the projections were completed, an error was discovered in the projected survival rates from age 54 to age 55 for White males. A more reasonable set of projected survival rates for 50 to 54 surviving to 55 to 59 follows:

	1980 to 1985	1985 to 1990	1990 to 1995	1995 to 2000	2000 to 2005	2005 to 2010	2010 to 2015	2015 to 2020	2020 to 2025
Both sexes	.954982	.955619	.956257	.956894	.957532	.958169	.958807	.959444	.960082
Male	.940472	.941217	.941962	.942708	.943453	.944198	.944943	.945689	.946434

Table B-2. WHITE POPULATION AND BLACK POPULATION—ESTIMATES AND PROJECTIONS OF FIVE-YEAR SURVIVAL RATES BY AGE AND SEX: 1976 TO 2000

(Projected survival rates are based on projections of population in 5-year age groups assuming no net immigration. These rates reflect projected survival rates by single year of age and the age distribution within each age group. These survival rates are consistent with population adjusted to reflect estimated net census undercount. See text for discussion of methodology and assumptions)

Initial age	Terminal age	White population					Black population				
		1976[1]	1980 to 1985	1985 to 1990	1990 to 1995	1995 to 2000	1976[1]	1980 to 1985	1985 to 1990	1990 to 1995	1995 to 2000

[1] Based on life tables for 1976.

[2] After the projections were completed, an error was discovered in the projected survival rates from age 54 to 55 for White males. A more reasonable set of projected survival rates for 50 to 54 surviving to 55 to 59 follows:

	1980 to 1985	1985 to 1990	1990 to 1995	1995 to 2000
Both sexes	.957497	.957948	.958399	.958850
Male	.943321	.943855	.944389	.944923

Table B-3. ESTIMATES OF ONE-YEAR SURVIVAL RATES BY RACE FOR 1976 AND PROJECTIONS OF ULTIMATE ONE-YEAR SURVIVAL RATES, BY SEX AND SINGLE YEAR OF AGE

(These survival rates are consistent with population adjusted to reflect estimated net census undercount. See text for discussion of methodology and assumptions)

[1] Series II-X represents one path to zero population growth. See introductory section of the text for a discussion of this concept.

Table D-2. SERIES II-X—PROJECTIONS OF THE TOTAL POPULATION BY AGE AND SEX, FOR THE UNITED STATES: SELECTED YEARS, 1980 TO 2050

(Numbers in thousands. As of July 1. Includes Armed Forces overseas. See text for methodology and assumptions)

Sex and age	1980	1985	1990	1995	2000	2010	2020	2025	2030	2040	2050	Ultimate stationary population (percent distribution)[1]
